Additional New ASN.1 Modules for the Cryptographic Message Syntax (CMS) and the Public Key Infrastructure Using X.509 (PKIX)

Abstract

The Cryptographic Message Syntax (CMS) format, and many associated formats, are expressed using ASN.1. The current ASN.1 modules conform to the 1988 version of ASN.1. This document updates some auxiliary ASN.1 modules to conform to the 2008 version of ASN.1; the 1988 ASN.1 modules remain the normative version. There are no bits-on-the-wire changes to any of the formats; this is simply a change to the syntax.

Status of This Memo

This document is not an Internet Standards Track specification; it is published for informational purposes.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Not all documents approved by the IESG are a candidate for any level of Internet Standard; see Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at http://www.rfc-editor.org/info/rfc6268.

Schaad & Turner               Informational                     [Page 2]
1. Introduction

Some developers would like the IETF to use the latest version of
ASN.1 in its standards. Most of the RFCs that relate to security
protocols still use ASN.1 from the 1988 standard, which has been
deprecated. This is particularly true for the standards that relate
to PKIX, CMS, and Secure/Multipurpose Internet Mail Extensions
(S/MIME).

In this document we have either changed the syntax to use the 2008
ASN.1 standard, or done some updates from previous conversions. The
ASN.1 modules updated came from the following RFCs:

- RFC 3274, Compressed Data Content Type for Cryptographic Message
  Syntax (CMS) [RFC3274].
- RFC 3779, X.509 Extensions for IP Addresses and AS Identifiers
  [RFC3779].
- RFC 6019, BinaryTime: An Alternate Format for Representing Date
  and Time in ASN.1 [RFC6019].
- RFC 4073, Protecting Multiple Contents with the Cryptographic
  Message Syntax (CMS) [RFC4073].
- RFC 4231, Identifiers and Test Vectors for HMAC-SHA-224,
  HMAC-SHA-256, HMAC-SHA-384, and HMAC-SHA-512 [RFC4231].
- RFC 4334, Certificate Extensions and Attributes Supporting
  Authentication in Point-to-Point Protocol (PPP) and Wireless Local
  Area Networks (WLAN) [RFC4334].
- RFC 5083, Cryptographic Message Syntax (CMS) Authenticated-
  Enveloped-Data Content Type [RFC5083].
- RFC 5652, Cryptographic Message Syntax (CMS) [RFC5652].
- RFC 5752, Multiple Signatures in Cryptographic Message Syntax
  (CMS) [RFC5752].

Note that some of the modules in this document get some of their
definitions from places different than the modules in the original
RFCs. The idea is that these modules, when combined with the modules
in [RFC5911] and [RFC5912], can stand on their own and do not need to
import definitions from anywhere else.
This document does not explicitly update the RFCs from which the
ASN.1 modules have been extracted. This is because the original 1988
ASN.1 syntax remains the normative version and the modules in this
document as well as in [RFC5911] and [RFC5912] are informative (but
hopefully useful) annexes.

1.1. ASN.1 Updates (2002 to 2008)

The modules defined in this document are compatible with the most
current ASN.1 specification published in 2008 (see [ASN1-2008]). The
changes between the 2002 specification and the 2008 specification
include the creation of additional pre-defined types (DATE, DATE-
TIME, DURATION, NOT-A-NUMBER, OID-IRI, RELATIVE-OID-IRI, TIME, TIME-
OF-DAY) and the ability to define different encoding rules (ENCODING-
CONTROL, INSTRUCTIONS). None of the newly defined tokens are
currently used in any of the ASN.1 specifications published here.

Information on the changes to ASN.1 between the 1988 and 2002
versions can be found in [RFC6025].

1.2. Requirements Terminology

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this
document are to be interpreted as described in [RFC2119].
2. ASN.1 Module RFC 3274

We have updated the ASN.1 module associated with this document to be 2008 compliant and to use the set of classes previously defined in [RFC5911].

ContentSet CONTENT-TYPE ::= {
  ct-ContentCollection | ct-ContentWithAttributes, ...
}
6. ASN.1 Module RFC 4231

RFC 4231 does not contain an ASN.1 module to be updated. We have therefore created an ASN.1 module to represent the ASN.1 that is present in the document. Note that the parameters are defined as expecting a parameter for the algorithm identifiers in this module; this is different from most of the algorithms used in PKIX and S/MIME. There is no concept of being able to truncate the MAC (Message Authentication Code) value in the ASN.1 unlike the XML definitions. This is reflected by not having a minimum MAC length defined in the ASN.1.

8.  ASN.1 Module RFC 5083

This module is updated from RFC 5911 [RFC5911] by the following changes:

1. Define separate attribute sets for the unprotected attributes used in EnvelopedData, EncryptedData, and AuthenticatedEnvelopedData (RFC 5083).

2. Define a parameterized type EncryptedContentInfoType so that the basic type can be used with different algorithm sets (used for EnvelopedData, EncryptedData, and AuthenticatedEnvelopedData (RFC
5083)). The parameterized type is assigned to an unparameterized type of EncryptedContentInfo to minimize the output changes from previous versions.

Protocol designers can make use of the ’08 ASN.1 constraints to define different sets of attributes for EncryptedData and EnvelopedData and for AuthenticatedData and AuthEnvelopedData. Previously, attributes could only be constrained based on whether they were in the clear or unauthenticated not on the encapsulating content type.

END

9. ASN.1 Module RFC 5652

This module is updated from RFC 5911 [RFC5911] by the following changes:

1. Define separate attribute sets for the unprotected attributes
used in EnvelopedData, EncryptedData, and
AuthenticatedEnvelopedData (RFC 5083).

2. Define a parameterized type EncryptedContentInfoType so that the
basic type can be used with algorithm sets (used for
EnvelopedData, EncryptedData, and AuthenticatedEnvelopedData (RFC
5083)). The parameterized type is assigned to an unparameterized
type of EncryptedContentInfo to minimize the output changes from
previous versions.

We are anticipating the definition of attributes that are going to be
restricted to the use of only EnvelopedData. We are therefore
separating the different attribute sets so that protocol designers
that need to do this will be able to define attributes that are used
for EnvelopedData, but not for EncryptedData. The same separation is
also being applied to AuthenticatedData and AuthEncryptedData.

10. ASN.1 Module RFC 5752

We have updated the ASN.1 module associated with this document to be 2008 compliant and to use the set of classes previously defined in [RFC5911].

MultipleSignatures-2010
  { iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs9(9)
    smime(16) modules(0) id-mod-multipleSign-2009(59) }

DEFINITIONS IMPLICIT TAGS ::= BEGIN
  -- EXPORTS All
  -- The types and values defined in this module are exported for use
  -- in the other ASN.1 modules. Other applications may use them for
  -- their own purposes.

  IMPORTS
    -- Imports from PKIX-Common-Types-2009 [RFC5912]

    ATTRIBUTE
      FROM PKIX-CommonTypes-2009
      { iso(1) identified-organization(3) dod(6) internet(1)
        security(5) mechanisms(5) pkix(7) id-mod(0)
        id-mod-pkixCommon-02(57) }

    -- Imports from CryptographicMessageSyntax-2010 [RFC6268]

    DigestAlgorithmIdentifier, SignatureAlgorithmIdentifier
      FROM CryptographicMessageSyntax-2010
      { iso(1) member-body(2) us(840) rsadsi(113549)
        pkcs(1) pkcs-9(9) smime(16) modules(0) id-mod-cms-2009(58) }
-- Imports from ExtendedSecurityServices-2009 [RFC5911]

ESSCertIDv2
FROM ExtendedSecurityServices-2009
{ iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs-9(9)
  smime(16) modules(0) id-mod-ess-2006-02(42) }

-- Section 3.0
--
-- at-multipleSignatures should be added ONLY to the
--    SignedAttributesSet defined in [RFC5652]
--

at-multipleSignatures ATTRIBUTE ::= {
  TYPE MultipleSignatures
  IDENTIFIED BY id-aa-multipleSignatures
}

id-aa-multipleSignatures OBJECT IDENTIFIER ::= {
  iso(1) member-body(2) us(840) rsadsi(113549) pkcs(1) pkcs9(9)
  id-aa(2) 51 }

MultipleSignatures ::= SEQUENCE {
  bodyHashAlg     DigestAlgorithmIdentifier,
  signAlg         SignatureAlgorithmIdentifier,
  signAttrsHash   SignAttrsHash,
  cert            ESSCertIDv2 OPTIONAL
}

SignAttrsHash ::= SEQUENCE {
  algID            DigestAlgorithmIdentifier,
  hash             OCTET STRING
}

END

11. Module Identifiers in ASN.1

One potential issue that can occur when updating modules is the fact that a large number of modules may need to be updated if they import from a newly updated module. This section addresses one method that can be used to deal with this problem, but the modules in this document don’t currently implement the solution discussed here.
When looking at an import statement, there are three portions: The list of items imported, a textual name for the module, and an object identifier for the module. Full implementations of ASN.1 do module matching using first the object identifier, and if that is not present, the textual name of the module. Note however that some older implementations used the textual name of the module for the purposes of matching. In a full implementation, the name assigned to the module is scoped to the ASN.1 module that it appears in (and thus the need to match the module it is importing from).

One can create a module that contains only the module number assignments and import the module assignments from the new module. This means that when a module is replaced, one can replace the previous module, update the module number assignment module, and recompile without having to modify any other modules.

A sample module assignment module would be:

ModuleNumbers
DEFINITIONS TAGS ::= 
BEGIN
  id-mod-CMS ::= { iso(1) member-body(2) us(840) rsadsi(113549)
                pkcs(1) pkcs-9(9) smime(16) modules(0) 58 }
  id-mod-AlgInfo ::= 
    {iso(1) identified-organization(3) dod(6) internet(1)
     security(5) mechanisms(5) pkix(7) id-mod(0)
     id-mod-algorithmInformation-02(58)}
END

This would be used in the following import statement:

IMPORTS
  id-mod-CMS, id-mod-AlgInfo
  FROM ModuleNumbers  -- Note it will match on the name since no
  -- OID is provided

  CMSVersion, EncapsulatedContentInfo, CONTENT-TYPE
  FROM CryptographicMessageSyntax-2010
  id-mod-CMS

  AlgorithmIdentifier(), SMIME-CAPS, ParamOptions
  FROM AlgorithmInformation-2009 id-mod-AlgInfo
;
12. Security Considerations

This document itself does not have any security considerations. The ASN.1 modules keep the same bits-on-the-wire as the modules that they replace.
