Abstract

This memo deprecates MIB module NAT-MIB, a portion of the Management Information Base (MIB) previously defined in RFC 4008 for devices implementing Network Address Translator (NAT) function. A companion document defines a new version, NATV2-MIB, which responds to deficiencies found in module NAT-MIB and adds new capabilities.

This document obsoletes RFC 4008. All MIB objects specified in RFC 4008 are included in this version unchanged with only the STATUS changed to deprecated.

Status of This Memo

This is an Internet Standards Track document.

This document is a product of the Internet Engineering Task Force (IETF). It represents the consensus of the IETF community. It has received public review and has been approved for publication by the Internet Engineering Steering Group (IESG). Further information on Internet Standards is available in Section 2 of RFC 5741.

Information about the current status of this document, any errata, and how to provide feedback on it may be obtained at http://www.rfc-editor.org/info/rfc7658.
1. Introduction

This memo deprecates a portion of the Management Information Base (MIB), MIB module NAT-MIB, for devices implementing the Network Address Translator (NAT) function. New implementations are encouraged to base themselves upon the second version of this MIB module, NATV2-MIB, defined in [RFC7659]. NAT types and their characteristics are defined in [RFC2663]. Traditional NAT function, in particular, is defined in [RFC3022]. Neither NAT-MIB nor NATV2-MIB addresses firewall functions, and neither can be used for configuring or monitoring them.

Section 2 provides references to the Simple Network Management Protocol (SNMP) management framework, which was used as the basis for the original MIB module definition and its deprecation. Section 3 provides motivation for the deprecation of module NAT-MIB and its replacement by module NATV2-MIB. Section 4 has the complete NAT-MIB module definition, with the STATUS of all objects changed to
deprecated. Section 5 describes security considerations relating to
NAT-MIB, basically relying on the security considerations in
[RFC4008] and [RFC7659].

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT",
"SHOULD", "SHOULD NOT", "RECOMMENDED", "NOT RECOMMENDED", "MAY",
and "OPTIONAL" in this document are to be interpreted as described in
[RFC2119].

2. The Internet-Standard Management Framework

For a detailed overview of the documents that describe the current
Internet-Standard Management Framework, please refer to section 7 of
RFC 3410 [RFC3410].

Managed objects are accessed via a virtual information store, termed
the Management Information Base or MIB. MIB objects are generally
accessed through the Simple Network Management Protocol (SNMP).
Objects in the MIB are defined using the mechanisms defined in the
Structure of Management Information (SMI). This memo specifies a MIB
module that is compliant to the SMIv2, which is described in STD 58,
RFC 2578 [RFC2578], STD 58, RFC 2579 [RFC2579], and STD 58, RFC 2580
[RFC2580].

3. Motivation For Deprecating NAT-MIB

This section provides the motivation for deprecating the NAT-MIB
module and its replacement by a new version.

3.1. Deprecated Features

All objects defined in [RFC4008] have been marked with "STATUS
deprecated" for the following reasons:

Writability: Experience with NAT has shown that implementations vary
tremendously. The NAT algorithms and data structures have little
in common across devices, and this results in wildly incompatible
configuration parameters. Therefore, few implementations were
ever able to claim full compliance.

Lesson learned: the MIB should be read-only as much as possible.
Exposing configuration parameters: Even in read-only mode, many configuration parameters were exposed by [RFC4008] (e.g., timeouts). Since implementations vary wildly in their sets of configuration parameters, few implementations could claim even basic compliance.

Lesson learned: the NAT-MIB’s purpose is not to expose configuration parameters.

Interfaces: Objects from [RFC4008] tie NAT state with interfaces (e.g., the interface table, the way map entries are grouped by interface). Many NAT implementations either never keep track of the interface or associate a mapping to a set of interfaces. Since interfaces are at the core of [RFC4008], many NAT devices were unable to have a proper implementation.

Lesson learned: NAT is a logical function that may be independent of interfaces. Do not tie NAT state with interfaces.

NAT service types: [RFC4008] used four categories of NAT service: basicNat, napt, bidirectionalNat, twiceNat. These are ill-defined, and many implementations either use different categories or do not use categories at all.

Lesson learned: do not try to categorize NAT types.

Limited transport protocol set: The set of transport protocols was defined as: other, icmp, udp, and tcp. Furthermore, the numeric values corresponding to those labels were arbitrary, without relation to the actual standard protocol numbers. This meant that NAT implementations were limited to those protocols and were unable to expose information about DCCP, SCTP, etc.

Lesson learned: use standard transport protocol numbers.

3.2. Desirable New Features

A number of desirable new features have been identified that are not present in NAT-MIB. See the latter part of Section 2 of [RFC7659].
4. Definitions

This MIB module IMPORTs objects from [RFC2578], [RFC2579], [RFC2580], [RFC2863], [RFC3411], and [RFC4001]. It also refers to information in [RFC792], [RFC4443], and [RFC3413].

natNotifThrottlingInterval OBJECT-TYPE
SYNTAX      Integer32 (0 | 5..3600)
UNITS       "seconds"
MAX-ACCESS  read-write
STATUS      deprecated
DESCRIPTION "This object controls the generation of the natPacketDiscard notification.

If this object has a value of zero, then no natPacketDiscard notifications will be transmitted by the agent.

If this object has a non-zero value, then the agent must not generate more than one natPacketDiscard 'notification-event' in the indicated period, where a 'notification-event' is the generation of a single notification PDU type to a list of notification destinations. If additional NAT packets are discarded within the throttling period, then notification-events for these changes must be suppressed by the agent until the current throttling period expires.
If natNotifThrottlingInterval notification generation is enabled, the suggested default throttling period is 60 seconds, but generation of the natPacketDiscard notification should be disabled by default.

If the agent is capable of storing non-volatile configuration, then the value of this object must be restored after a reinitialization of the management system.

The actual transmission of notifications is controlled via the MIB modules in RFC 3413. Deprecated in favor of NATV2-MIB.

::= { natAddrMapEntry 3 }

natAddrMapTranslationEntity OBJECT-TYPE
SYNTAX NatTranslationEntity
MAX-ACCESS read-create
STATUS deprecated
DESCRIPTION
"The endpoint entity (source or destination) in
inbound or outbound sessions (i.e., first packets) that
may be translated by an address map entry.

Session direction (inbound or outbound) is
derived from the direction of the first packet
of a session traversing a NAT interface.
NAT address (and Transport-ID) maps may be defined
to effect inbound or outbound sessions.

Traditionally, address maps for Basic NAT and NAPT are
configured on a public interface for outbound sessions,
effecting translation of source endpoint. The value of
this object must be set to outboundSrcEndPoint for
those interfaces."
Alternately, if address maps for Basic NAT and NAPT were
to be configured on a private interface, the desired
value for this object for the map entries
would be inboundSrcEndPoint (i.e., effecting translation
of source endpoint for inbound sessions).

If twiceNAT were to be configured on a private
interface, the desired value for this object for the map
entries would be a bitmask of inboundSrcEndPoint and
inboundDstEndPoint.
Deprecated in favor of NATV2-MIB.

REFERENCE "RFC 7658, RFC 7659"
 ::= { natAddrMapEntry 4 }
only a single address is being mapped, the value of this
object is equal to the value of natAddrMapLocalAddrFrom.  
For a static NAT, the number of addresses in the range
defined by natAddrMapLocalAddrFrom and
natAddrMapLocalAddrTo must be equal to the number of
addresses in the range defined by
natAddrMapGlobalAddrFrom and natAddrMapGlobalAddrTo.
The value of this object must be greater than or equal
to the value of the natAddrMapLocalAddrFrom object.

The type of this address is determined by the value of
the natAddrMapLocalAddrType object.
Deprecated in favor of NATV2-MIB."

SYNTAX    SEQUENCE OF NatAddrBindEntry
MAX-ACCESS not-accessible
STATUS     deprecated
DESCRIPTION
          "This table holds information about the currently active NAT BINDs. 
          Deprecated in favor of NATV2-MIB." 
REFERENCE "RFC 7658, RFC 7659"
::= { natMIBObjects 6 }

Each entry in this table holds information about an active address BIND. These entries are lost upon agent restart.

This row has indexing that may create variables with more than 128 subidentifiers. Implementers of this table must be careful not to create entries that would result in OIDs that exceed the 128 subidentifier limit. Otherwise, the information cannot be accessed using SNMPv1, SNMPv2c, or SNMPv3.

Deprecated in favor of NATV2-MIB.

natSessionPrivateSrcAddr OBJECT-TYPE
SYNTAX     InetAddress
MAX-ACCESS read-only
STATUS     deprecated
DESCRIPTION  "The source IP address of the session endpoint that
lies in the private network.

The value of this object must be zero only when the
natSessionPrivateSrcEPBindId object has a zero value. When the
value of this object is zero, the NAT session lookup will match any IP address to this field.

The type of this address is determined by the value of
the natSessionPrivateAddrType object. Deprecated in favor of NATV2-MIB."
REFERENCE   "RFC 7658, RFC 7659"
::= { natSessionEntry 11 }

natSessionPrivateSrcPort OBJECT-TYPE
SYNTAX     InetPortNumber
MAX-ACCESS read-only
STATUS     deprecated
DESCRIPTION  "For a protocol value of TCP or UDP, this object
represents the source port in the first packet of a
session while in a private realm. On the other hand, when
the protocol is ICMP, a NAT session is created only for
query/response-type ICMP messages such as ICMP echo,
Timestamp, and Information request messages, and this
object represents the private-realm specific identifier
in the ICMP message, as defined in RFC 792 for ICMPv4
and in RFC 4443 for ICMPv6.

The value of this object must be zero when the
natSessionPrivateSrcEPBindId object has zero value
and value of natSessionPrivateSrcEPBindMode is
addressPortBind(2). In such a case, the NAT session lookup will match any port number to this field.

The value of this object must be zero when the object is not a representative field (SrcPort, DstPort, or ICMP identifier) of the session tuple in either the public realm or the private realm. Deprecated in favor of NATV2-MIB."

natMIBReadOnlyCompliance MODULE-COMPLIANCE
  STATUS deprecated
  DESCRIPTION

Perreault, et al. Standards Track
"When this MIB is implemented without support for read-create (i.e., in read-only mode), then such an implementation can claim read-only compliance. Such a device can then be monitored but cannot be configured with this MIB.

The following index objects cannot be added as OBJECT clauses but nevertheless have the compliance requirements:

Deprecated in favor of NATV2-MIB."

END
5. Security Considerations

All objects in this MIB module have been deprecated. As a result, the security considerations in [RFC7659] apply instead. Amongst other matters, these considerations cover the case where both this MIB module and NATV2-MIB are present. In fact, such a situation is unlikely because [RFC4008], as a MIB module oriented toward configuration, was overtaken by events and saw little implementation.

6. IANA Considerations

IANA has assigned object identifier 123 to the natMIB module, with prefix iso.org.dod.internet.mgmt.mib-2 in the Network Management Parameters registry [SMI-NUMBERS].

IANA has marked that identifier as DEPRECATED and updated the reference from [RFC4008] to the present document.
